

Infrastructure as Code:

Managing IXP services using Terraform and the IX-API

Why?

- Treat the state of your **infrastructure as code**:
 - **Versions and change history**
 - **Collaborate** on infrastructure
- **Automate everything!**

IX  API

What is the IX-API?

- Joint effort by internet exchanges and others to provide a common API for configuring and provisioning infrastructure.

AMS-IX

✉ ix-api@ams-ix.net
🌐 www.ams-ix.net

DE-CIX

✉ api@de-cix.net
🌐 www.de-cix.net

DE-CIX API accessible at <https://www.de-cix.net/en/resources/de-cix-api>

LINX

✉ api@linx.net
🌐 www.linx.net

LINX API accessible at <https://ix-api.linx.net/api/v1>

IX-API (2.4.1)

Download OpenAPI specification: [Download](#)

URL: <https://ix-api.net> | License: Apache 2.0

This API allows to configure/change/delete Internet Exchange services.

Filters

When querying collections, the provided query parameters are validated. Unknown query parameters are ignored. Providing invalid filter values should yield a validation error.

State

A lot of resources are stateful, indicated by the presence of a `state` property, to support the inherently asynchronous nature of provisioning, deployment and on-boarding processes.

The following table describes the meaning of each state:

State	Meaning
requested	Resource has been requested by the customer but not yet fully reserved (sub-resources required)
allocated	All resources required for service are reserved
testing	The resource is provisioned and is currently being tested
production	The resource is active and can be used by the customer
production_change_pending	The resource is active but the customer has requested a change that is awaiting completion
decommission_requested	The resource is active but the customer has requested disconnection that is awaiting completion
decommissioned	The resource has been de-provisioned and billing is terminated or scheduled for termination

accounts

An `Account` represents an individual customer account, organization or partner involved with the IXP. They are used to consume services from an IXP.

Accounts can have a hierarchy, i.e. an account can have sub-accounts. The max-depth of the account-hierarchy may vary by implementer, but it's safe to assume an account can have sub-accounts.

Each `Account` has a state. Only `Account`s in state `production` or `production_change_pending` are ready to consume services.

There are `Contact`s associated with each account. Contacts can be assigned for `Role`s via `RoleAssignment`s. Depending on the IXP and the services the account wants to use, contacts with specific roles may be required. A contact with role `legal` is mandatory for an account to become operational.

Only accounts with `billing_information` present can be used as a `billing_account`.

Sensitive Properties: Please note, that an `Account` is a shared resource and fields marked as *sensitive* should be redacted.

accounts_list

Retrieve a list of `Account`s.

This includes all accounts the currently authorized account is managing and the current account itself.

Also `discoverable` accounts will be included, however sensitive properties, like `address` or `external_ref` will either not be present or redacted.

AUTHORIZATIONS: (OAuth (ix-api)) OR (Bearer)

QUERY PARAMETERS

id	Array of strings Example: id=id1, id2, id3 Filter by id
state	string Filter by state
state_is_not	string Filter by state_is_not
managing_account	string Filter by managing_account

network-services

A `NetworkService` represents an instance of a `ProductOffering`.

The exchange lan is a special case in which the `NetworkService` is managed by the exchange.

All other `NetworkService`s are created and managed by an `Account`.

Sensitive Properties: Please note, that a `NetworkService` may be a shared resource and fields marked as *sensitive* should be redacted.

network_services_list

List available `NetworkService`s.

AUTHORIZATIONS: (OAuth (ix-api)) OR (Bearer)

QUERY PARAMETERS

id	Array of strings Example: id=id1, id2, id3 Filter by id
state	string Filter by state
state_is_not	string Filter by state_is_not
managing_account	string Filter by managing_account
consuming_account	string Filter by consuming_account
external_ref	string Filter by external_ref
type	string Enum: "exchange_lan" "p2p_vc" "p2mp_vc" "mp2mp_vc" "cloud_vc" Filter by type
pop	string Filter by pop
product_offering	string Filter by product_offering

What is Terraform?

- **Configuration** describes the infrastructure
- **Provider** builds the infrastructure
 - Data source
 - Resource
- **State** tracks resource changes

```
# Create a AWS EC2 instance
resource "aws_instance" "app_server" {
  ami           = "ami-830c94e3"
  instance_type = "t2.micro"
  tags = {
    Name = "ExampleAppServerInstance"
  }
}

# Get a known IX-API account
data "ixapi_account" "hajnet" {
  external_ref = "c-hajnet-as-65500"
}

# Manage a MAC address for Blåhajnet Inc
resource "ixapi_mac" "hajnet_fra_gw0" {
  managing_account = data.ixapi_account.hajnet.id
  consuming_account = data.ixapi_account.hajnet.id
  address = "21:42:ff:00:23:42"
}
```

What is a data source?

- **Read-Only** data
- **Declarative** query
- Use the data when declaring resources

```
# IX-API customer account
data "ixapi_account" "hajnet" {
  external_ref = "c-hajnet-as-65500"
}

# Product offering
data "ixapi_product_offering_exchange_lan" "peering_fra" {
  id = 522 # From IXP-Website
}

# Network service and network features
data "ixapi_network_service_exchange_lan" "peering_fra" {
  id = data.ixapi_product_offering_exchange_lan.peering_fra.exchange_lan_network_service
}

data "ixapi_network_features_route_server" "peering_fra" {
  network_service = data.ixapi_network_service_exchange_lan.peering_fra.id
}
```

What is a data source?

```
data "ixapi_network_features_route_server" "peering_fra" {
  network_service = data.ixapi_network_service_exchange_lan.peering_fra.id
}
```

```
network_feature = {
  address_families = [

Using the ix-api-client

```
func main() {
    ctx := context.Background()

    fmt.Println("ix-api list network services")

    c := ixapi.NewClient("http://localhost:8000/api/v2")

    if err := c.Authenticate(ctx, &ixapi.AuthAPIKeySecret{
        Key:    os.Getenv("IX_API_KEY"),
        Secret: os.Getenv("IX_API_SECRET"),
    }); err != nil {
        log.Fatal(err)
    }

    // Network services
    ns, err := c.NetworkServicesList(ctx)
    if err != nil {
        log.Fatal(err)
    }
    for _, n := range ns {
        // We are only interested in exchange lan network services
        ens, ok := n.(*ixapi.ExchangeLanNetworkService)
        if !ok {
            continue
        }
        // Get required features for network services
        nfs, err := c.NetworkFeaturesList(ctx, &ixapi.NetworkFeaturesListQuery{
            NetworkService: ens.ID,
            Required:        "true",
        })
        if err != nil {
            log.Fatal(err)
        }
        fmt.Println("Required network features for exchange-lan:", ens.Name)
        for _, nf := range nfs {
            rsnf, ok := nf.(*ixapi.RouteServerNetworkFeature)
            if !ok {
                continue
            }
            fmt.Println(" * ", rsnf.Name, "ID:", rsnf.ID)
        }
    }
}
```

Get a list of all **polymorphic network services**

Query **network features**

Show required **route server** network features for **exchange lan** network services

<https://gitlab.com/ix-api/ix-api-client-go>

What is a resource?

- Managed by terraform, **Read-Write**
- **Config is Source Of Truth**
- **Changes** in config will **affect infrastructure**

```
data "ixapi_account" "hajnet" {
  external_ref = "demo_reseller"
}

resource "ixapi_mac" "hajnet_fra_gw1" {
  managing_account = data.ixapi_account.hajnet.id
  consuming_account = data.ixapi_account.hajnet.id
  address = "22:42:69:70:f3:df"
}
```

What is a resource?

```
resource "ixapi_mac" "hajnet_fra_gw1" {  
  managing_account = data.ixapi_account.hajnet.id  
  consuming_account = data.ixapi_account.hajnet.id  
  address = "22:42:69:70:f3:df"  
}
```

```
hajnet_mac_gw1_fra = {  
  address = "22:42:69:70:f3:df"  
  consuming_account = "17"  
  external_ref = null

  managing_account = "17"  
  valid_not_after = null  
  valid_not_before = "2022-10-24T18:08:16Z"  
}
```

macs_create

Register a mac address.

AUTHORIZATIONS: (OAuth (ix-api)) OR (Bearer)

REQUEST BODY SCHEMA: application/json

MAC-Address Request

managing_account required	string	The id of the account responsible for managing the service via the API. A manager can read and update the state of entities.
consuming_account required	string	The id of the account consuming a service. Used to be owning_customer .
external_ref	string or null <= 128 characters	Reference field, free to use for the API user. (<i>Sensitive Property</i>)
address required	string	Unicast MAC address, formatted hexadecimal values with colons.
valid_not_before	string or null <date-time>	
valid_not_after	string or null <date-time>
